were used as a driver for normalization. Hybridization between the single-stranded library and the PCR products was carried out for 44 hours at 30C. Unhybridized single-stranded DNA circles were separated from hybridized DNA rendered partially double-stranded and electroporated into DHIOBs cells to generate the normalized library. The total number of clones with insert was 9x10°6 cfu. Background of empty clones was less than 1%."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 632 bp mRNA linear EST 05-AUG-2003 cDNA library from cambial zone Populus alba 5', mRNA sequence.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ਨੇ
/tissue_type="cambial zone harvested on the bark side"
/dev stage="3-years-old poplar trees grown in the nursery"
/clone_lib="Poplar cDNA library from cambial zone"
/note="A composite cDNA library was made with mRNA
isolated from opposite and tension wood tissues
corresponding to the cambial zone collected on the bark
side after debarking the stem. In this respect, in
addition to cambium cDNA, this library also contains very
young phloem and very young xylem cDNA. The sampling was
done on 3 different tilted trees grown in the nursery.
CDNA were cloned in an oriented way into Sfil (A and B)
restriction sites. A one-step conversion of Lambda
TriplEx2 to the corresponding priplEx2 plasmid was done
via site-specific recombination at loxP sites (Clontech;
SWART CDNA library construction kit). CDNA inserts were
PCR amplified using glanking primers and then sequenced on
a ABI3100 Genetic Analyser (Applied Biosystem)"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Populus trichocarpa x Populus deltoides

Hubner (forest tent caterpillar) mid-instar larvae caged on the sapling using mesh bags. Mature leaves from within the caged regalon were collected 2 hours, 12 hours, 24 hours and 48 hours after the onset of treatment. mRNA was isolated from each tissue were then pooled. CDNA was prepared from S micrograms of mRNA and directionally ligated into the pBluescript II SK (+) XR vector using the pBluescript II XR cDNA library Construction kit according to manufacturer's instructions with modifications (Stratagene). Plasmid DNA was then transformed by electroporation into DH10B cells (Invitrogen) for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Populus trichocarpa x Populus deltoides

/note="Weator: pBluescript II SK (+) XR; Site 1: EcoRI (5'
end of cDNA); Site 2: Xhoi (3' end of cDNA); Sapling trees
two metres in height and grown under greenhouse conditions
were exposed to continuous feeding by Malacosoma disstria
Hubner (forest tent caterpillar) mid-instar larvae caded
on the sapling using mesh bags. Mature leaves from within
the caged region were collected 2 hours, 12 hours, 24
hours and 48 hours after the onset of treatment. mRNA was
isolated from each tissue source independently and equal
quantities of mRNA from each tissue were then pooled. cDNA
was prepared from S micrograms of mRNA and directionally
ligated into the pBluescript II SK (+) XR vector using the
pBluescript II XR CDNA tibrary Construction Kit according
to manufacturer's instructions with modificants.

/lone="vector: pBluescript I1 SK (+) XR; Site_I: EcoRI (5'
fnote="vector: pBluescript I1 SK (+) XR; Site_I: EcoRI (5'
end of cDNA); Site_2: XhoI (3' end of cDNA); Outer xylem
from 5 year old trees harvested every two weeks between
April and October of 2002 at the University of British
Columbia south campus farm in Vancouver, British Columbia.
mRNA was isolated from each tissue source independently
and equal quantities of mRNA from each tissue were then
pooled. cDNA was prepared from 5 micrograms of mRNA and
directionally ligated into the pBluescript II SK (+) XR
vector using the pBluescript II XR cDNA Library
Construction Kit according to manufacturer's instructions
with modifications (Stratagene). Plasmid DNA was then
transformed by electroporation into DH10B cells.

/lab host—"E. coil DH10B T1 phage resistant cells"
/lab host—"E. coil DH10B T1 phage resistant cells"
/clone lib="PT-DX-N-A-10"
/clone lib="PT-DX-N-A-10"
/note="Vector: pBluescript II SK (+) XR; Site 1: EcoRI (5')
end of cDNA); Site—2: Xhol (3' end of cDNA); Outer xylem
from 5 year old trees harvested every two weeks between
April and October of 2002 at the University of British
Columbia south campus farm in Vancouver. British Columbia.
mRNA was isolated from each tissue source independently
and equal quantities of mRNA from each tissue were then
pooled. cDNA was prepared from 5 micrograms of mRNA and
directionally ligated into the pBluescript II SK (+) XR
vector using the pBluescript II XR CDNA Library
Construction Kit according to manufacturer's instructions
with modifications (Strataggne). Plasmid DNA was then
transformed by electroporation into DH10B cells
                                                                          Eukaryota; Viridiplantae; Streptophyta; Embryophyta; Tracheophyta; Spermatophyta; Wagnoliophyta; eudicotyledons; core eudicotyledons; rosids; eurosids I; Malpighiales; Salicaceae; Saliceae; Populus. (bases 1 to 627)

                                                                                                                                                                                                                                                                       This invention relates to a novel plant transcription factor polypeptides, the DNA sequences which encode them and their use in creating transgenic plants. The transgenic plant and methods are useful for producing commercially or agriculturally useful plants having improved tolerance to drought, shade and low nitrogen conditions when compared to wild-type reference plants. The present sequence is that of plant transcription factor gene which was used during the development of

                                                                                                                                                                                                                                                                                                ö
                                           The invention relates to a transgenic plant that possesses a plant transformation vector comprising a nucleotide sequence that encodes a peronospora parasitica resistant (FPR2) protein, or a PFR2 orthologue. The transgenic plant is useful in generating plants with a pathogen resistance phenotype. The PPR2 nucleic acids and proteins of the having a modified pathogen resistance phenotype. The present blants what sequence encodes an Arabidopsis thaliana PPR2 protein of the invention.

Specifically, it refers to transcription factor proteins that are capable of binding to DNA in order to regulate gene transcription and gene expression in a plants, in particular Eucalyptus grandis and Pinus radiata. The present invention describes DNA constructs containing DNA encoding a transcription factor that regulates the promoter, which is operably linked to the desired nucleic acid to be expressed. It further provides transgenic plants expressing a transcription factor that confers a trait to the plant such as increased drought, salt or disease tolerance, height nutritional characteristics, as well as improved taste, starch composition, flower longevity and germination, amongst others.

Accordingly, such plants that are successfully transfected with a DNA

comprises transforming a plant having an improved property
comprises transforming a plant with a recombinant construct comprising a
promnet region functional in a plant cell operably joined to a
promnet region functional in a plant cell operably joined to a
conjuncted the property, and growing the transformed plant. The polypeptide is
useful for improving plant cold tolerance, manipulating growth rate in
plant cells by modification of the cell cycle pathway, improving plant
drought tolerance, providing increased resistance to plant disease,
producing galactomannan (or lignin or plant growth regulators), improving
the rate of homologous recombination in plants, improving plant tolerance
the rate of homologous recombination in plants, improving yield
the rate of homologous recombination in plants, improving yield
to extreme osmotic conditions or to pathogens or pests, increasing
the rate of homologous recombination in plants, improving yield
by modification of photosynthesis, modification of carbohydrate, nitrogen
or phosphorus use and/or uptake, or improving yield by providing improved
con phosphorus use and/or uptake, or improving yield by providing improved
constructs, in physical arrays of molecules, as plant breeding markers,
constructs, in physical arrays of molecules, as plant breeding markers,
constructs, in physical arrays of molecules, as plant breeding markers,
con in computer-based storage and analysis systems. The present sequence
is a Cotton plant cDNA of the invention. NOTE: The sequence data for this
patent did not form part of the printed specification, but was obtained
in electronic format directly from USPTO at
sequences were available, the remaining 52213
colymucleotides sequences here available, the remaining 52213
colymucleotides and all 58798 protein sequences were not present.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              138 CATGGACAGCCAAGCAAACAAAGATTTCGAAAGGGCTTTAGCTGTTTACGACAAGGACA 197

The invention relates to 17880 cotton expressed sequence tags (ESTB;

ACN45220-ACN63099). The ESTB were isolated from CDNA libraries generated

CC from primed on non-primed seeds from variety DPSDB, mature seeds from

variety Coker 312 Boswell 96 Field, and androecium tissue, gynoecium

tissue, developing fibres, carpel walls and septa from variety

CC tissue, developing fibres, carpel walls and septa from variety

Nucotton33B. The invention also relates to substantially purified

CC invention, and to transformed plants having a nucleic acid molecules of the

invention, and to transformed plants having a nucleic acid molecules of the

comprising a nucleic acid of the invention. The cotton ESTB are useful as

CC molecular tags to isolate genetic regions, to isolate genes are

members of a particular gene family. The nucleic acid molecules may be

cc seed germine gene family. The nucleic acid molecules are

associated with plant growth, quality, yield, and could also serve as

clinks in metabolic and catabolic pathways. The nucleic acid molecules are

also useful for identifying genes important in initiating also serve as

conting seed germination or that may be used to mitigate stresses encountered

contourers and cis-regulatory elements which will be useful to express

conforming seed germination of molecular markers useful for

significant genes in these tissues and/or other tissues,

conducters and cis-regulatory elements which will be useful for

significant genes in the compared and in cloning of agronomically

contour section the expression level or molecular markers useful for

detecting the expression level or gates on a protein or aproted from a

cotton variety Nucotton318 gynoecium tissue control of a protein or man a

section sequence date for this patent did not form part of the printed

cotton variety but was obtained in electronic formet directly entered the presence or general parts of the printed

cotton variety metabolic and molecular markers when the printed

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a recombinant polymucleotide comprising any of the 58798 Cotton plant cDNA sequences mentioned in the specification.

Also a recombinant polymeptide comprising any of the 58798 amino acid sequences mentioned in the specification and producing a plant having an improved property.

Comprises transforming a plant with a recombinant construct comprising a plant with a recombinant construct comprising a plant with a recombinant construct comprising a plant with a recombinant construct comprising a plant with a property.

CC comprises transforming a plant with a recombinant construct comprising a plant with a property and growing the transformed plant. The polypeptide associated with the property, and growing the transformed plant. The polypeptide is useful for improving plant coll colerance, manipulating growth rate in plant cells by modification of the cell cycle pathway, improving plant collamns (or lignin or plant growth regulators), improving plant tolerance, plant theat tolerance, improving plant tolerance to herbicides, increasing the rate of homologous recombination in plants, improving plant tolerance to extreme osmocic conditions or peace, improving yield by modification of photosynthesis, modifying seed oil or protein yield by modification of photosynthesis, modifying seed oil or protein yield by modification of photosynthesis, or improving yield by providing improved plant growth and development under at least one stress condition. The polynucleotide and polypeptide may also be used in recombinant DNA content tolerance and analysis systems. The present sequence constructs, in physical arrays of molecules, as plant breeding markers, or incomputer-based storage and analysis systems. The present sequence constructs for this prover. The present sequence is a cotton plant cDNA of the invention. NOTE: The sequence date for this content is the princed specification, but was obtained in the princed specification.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New recombinant nucleic acid molecules and polypeptides from Gossypium hirsutum, useful for producing plants with improved biological characteristics (e.g. improved plant cold or drought tolerance).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           in electronic format directly from USPTO at segdate.ueptor.gov/sequence.html?DocID=20040181830. However only 6585 polynuclectide sequences were averlable, the remaining 52213 polynuclectides and all 58798 protein sequences were not present.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 779 BP; 248 A; 121 C; 157 G; 253 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Cao Y;
```

New recombinant DNA construct, useful for improving plant tolerance to ocid, heart, drought, herbicides, extreme osmotic conditions, pathogens or pests, for conferring increased resistance to plant disease, or for improving yield. The invention describes a recombinant DNA construct comprising a polymucleotide consisting of a sequence encoding an amino acid sequence available in electronic form from the US patent offlice a to fitp ftp. sequence. The DDCID:3004034888. The polymucleotide of the invention are also useful in physical arrays of molecules and as Cao Tabaska JE, Screen SE, Claim 1; SEQ ID NO 14832; 15pp; English.

plant breeding markers. The recombinant DNA construct is useful for improving plant tolerance to cold, heat, drought, herbicides, extreme sometic conditions, pathogens or pests, for manipulating growth rate in plant cells by modification of the cell cycle pathway, for conferring increased resistance to plant disease, for producing galactomanna, lignin or plant growth regulators, for increasing the rate of homologous recombination in plants, for improving yield by modification of photosynthesis or carbohydrate, nitrogen or phosphorus use and/or uptake or by providing improved plant growth and development under at least one stress condition or for modifying seed oil or protein yield and/or content. This sequence represents a plant full length insert polynucleotide that can be used in the recombinant DNA construct of the

The invention relates to plant nucleotide sequences that direct seed.,

C leaf- and/or stem., panicle., root- or pollen-specific or -preferential

C c constitutive transcription of an operatively linked nucleic acid

c segment. The invention also relates to a method for augmenting a plant

c genome and a method of identifying a gene, where its expression is

altered in the seed, leaf, stem, panicle, pollan, root or is constitutive

c altered in the seed, leaf, stem, panicle, pollan, root or is constitutive

c an a plant cell. The plant is a creal, e.g. soybean, alfalfa, sunflower,

c anola, cotton, peanut, tobacco or sugar beet, preferably maize, barley,

c canola, cotton, peanut, tobacco or sugar beet, preferably maize, barley,

c canola, cotton, peanut, tobacco or sugar beet, preferably maize,

c canola, cotton, peanut, tobacco or sugar beet, preferably maize,

c canola, cotton, peanut, tobacco or sugar beet, preferably maize,

c canola, cotton, peanut, tobacco or sugar beet, preferably maize,

c canola, cotton, peanut, tobacco or sugar beet, preferably maize,

c canola, cotton, peanut, tobacco or sugar beet, preferably maize,

c canola, cotton, peanut, tobacco or sugar beet, preferably maize,

c canola, cor, wheat, the produce large quantities of oil or

c incur stress tolerance (e.g. salt, cold or drought) to ensure the plants

c incur stress tolerane (e.g. salt, cold or drought) to ensure the plants

c incur stress tolerand value with reduced apical dominance or dwarfism,

c arly flowering or altered metabolic pathways. This sequence erepresente a

c plant nucleic acid of the invention. Note: The sequence data for this

c patent did not form part of the printed specification but was obtained in

c electronic format directly from USPTO at seqdata.uspto.gov/sequence.html.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       288

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   07-JUN-1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    14-JUN-1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        18-JUN-1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               .-NUL-80
     and polypeptides. Also disclosed are vectors, expression cassettes, host cells, and plants containing such polynucleotides. Also disclosed are methods for using the polynucleotides and polypeptides to alter the methods for using the polynucleotides and polypeptides to alter the responsiveness of a plant to abiotic stress. The invention is useful in agriculture. The nucleic acid is useful for determining whether a test plant has been exposed to an abiotic stress condition. It is also useful for selecting an agent that alters abiotic stress regulated polynucleotide expression in a plant cell, and to identify a homolog or ortholog to an abiotic stress responsive polynucleotide. The nucleic acid molecule and the polypeptide encoded by it are useful in altering the stress, osmotic stress and in abiotic stress, such as cold stress, salt stress, osmotic stress and not their an abiotic stress, such as cold stress, salt is used in the exemplification of the invention
                                                                                                                                                                                                                                          New stress-responsive nucleic acid, useful for altering the responsiveness of a plant, e.g. cereal, to an abiotic stress such as cold stress, salt stress or osmotic stress.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            476 CTCCTCCTGGACGCGGAAGAGAAGAAGATGTTCGAGAAGGCACTGGCGGTGTACGACA 417

The invention relates to 17880 cotton expressed sequence tags (ESTs; ACN45220-ACN63099). The ESTs were isolated from CDNA libraries generated from primed or non-primed seeds from variety DPS60, mature seeds from variety Coker 312 Boswell 96 Field, and androecium tissue, gynoecium tissue, developing fibres, carpel walls and septe from variety Coker 312 Boswell 96 Field, and androecium tissue, gynoecium tissue, developing fibres, carpel walls and septe from variety Coker 512 Boswell 96 Field, and androecium tissue, gynoecium tissue, developing fibres, carpel walls and septe from variety CC worderings or their fragments encoded by nucleic acid molecules of the invention, and to transformed plants having a nucleic acid construct comprising a nucleic acid of the invention. The cotton ESTs are useful as molecular tags to isolate genetic regions, to isolate genes to members of a particular gene family. The nucleic acid molecules may be used for isolated gene family. The nucleic acid molecules may be useful for isolating a variety of agronomically significant genes are sequence of also useful for identifying genes important in initiating and maintaining seed germination or that may be used to mitigate stresses encountered during seed germination. The ESTs additionally enable the acquisition of promoters and cis-regulatory elements which will be useful to express cand also permits the acquisition of molecular markers useful in breeding schemes, genetic and molecular mapping, and in cloning of agronomically significant genes in these tissues and for expression level or pattern of a protein or mRNA and for detecting the expression level or pattern of a protein or wariety from a cotton variety Nucceton38 gynoecium tissue cDNA library (LIB3829). The sequence data for this patent did not form part of the printed considered to matern of a protein to fire the praint of the praince of the praince of the praince of the praince of the praince of the praince of the praince of the praince of the praince of the praince of the prainc

ACW45220-ACN63099). The ESTS were isolated from cDNA libraries generated from primed or non-primed seeds from variety DPSOB, mature seeds from variety Coker 312 Boswell 96 Field, and androecium tissue, gynoecium tissue, developing fibres, carple walls and septa from variety Nucotron33B. The invention also relates to substantially purified protectins or their fragments encoded by nucleic acid molecules of the invention, and to transformed plants having a nucleic acid construct comprising a nucleic acid of the invention. The cotron ESTs are useful as molecular tags to isolate genetic regions, to isolate genes, to map genes, to determine gene function and to determining whether genes are members of a particular gene family. The nucleic acid molecules may be used for isolating a variety of agronomically significant genes as associated with plant growth, quality, yield, and could also serve as links in metabolic and catabolic pathways. The nucleic acid molecules are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New isolated nucleic acid molecule that encodes a plant protein or its fragment, useful for isolating a variety of agronomically significant genes associated with plant growth, quality or yield, and as molecular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to 17880 cotton expressed sequence tags (ESTs;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     GAGGAAGTGAAGTTGCATTACCAGAACCTTGTGGATGACATCAAGCAGATAGAGTCTGGG 287
also useful for identifying genes important in initiating and maintaining seed germination or that may be used to mitigate stresses encountered during seed germination. The ESTs additionally enable the acquisition of promoters and cis-regulatory elements which will be useful to express and also permits the acquisition of molecular markers useful in breeding schemes, genetic and molecular mapping, and in cloning of agronomically significant genes. The nucleic acid molecules are further useful for detecting the expression level or pattern of a protein or mRNA and for detecting the expression level or pattern of a protein or mRNA and for petecting the presence or quantity of a protein by tissue printing. The present sequence represents a specifically claimed EST isolated from a cotton variety Nucotton33B gynoecium tissue CDNA library (LIB3829). The sequence data for this patent did not form part of the printed form a cotton wariety for this patent did not form part of the printed form and the control of the printed form and the cotton wariety for this patent did not form part of the printed form and the cotton wariety for this patent did not form part of the printed form and patent did not form part of the printed form and patent did not form part of the printed form and patent did not form part of the printed form and patent did not form part of the printed form and patent did not form part of the printed form and patent did not form part of the printed form and patent did not form part of the printed form and patent did not form part of the printed form and patent did not form part of the printed form and patent did not form part of the printed form and patent did not form part of the printed form and patent did not form part of the printed form and patent did not form part of the printed form and patent did not form part of the patent did not form and patent did not form and patent did not form and patent did not form and patent did not form and patent did not form and patent did not form and patent did not for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          81

The invention relates to 17880 cotton expressed sequence tags (ESTs;

ACN45220-ACN63099). The ESTs were isolated from cDNA libraries generated

from primed or non-primed seeds from variety DP50B, mature seeds from

variety Coker 312 Boswell 96 Field, and androecium tissue, gynoecium

tissue, developing fibres, carpel walls and septa from variety

CC tissue, developing fibres, carpel walls and septa from variety

Nucctorals. The invention also relates to substantially purified

proteins or their fragments encoded by nucleic acid molecules of the

invention, and to transformed plants having a nucleic acid construct

comprising a nucleic acid of the invention. The cotton ESTs are useful as molecular gene family. The nucleic acid molecules may be

compressed a particular gene family. The nucleic acid molecules may be

used for isolating a variety of agronomically significant genes are

also useful for identifying genes important in initiating and maintaining

seed germination or that may be used to mitigate stresses encountered

concerns and cis-regulatory elements which will be useful to express

concerns and cis-regulatory elements which will be useful to express

concerns and cis-regulatory elements which will be useful for detecting the expression level or pattern of a protein or molecular markers useful in breeding

concerns and cis-regulatory elements which will be useful for detecting the expression level or pattern of a protein or molecular markers useful for

detecting the presence or quantity of a protein or molecular markers useful for

detecting the expression level or pattern of a protein or melecular or maker and element evel or pattern of a protein or molecular in specifically claimed EST isolated from a contron variety Nucctonals approxime tissue edment of the printed

cotton variety Nucctonals approxime tissue of the printed

cotton variety Nucctonals approxime tissue of the printed

cotton variety of a programming the present did not form part of the printed

cotton variety was obtained in electro New isolated nucleic acid molecule that encodes a plant protein or its fragment, useful for isolating a variety of agronomically significant genes associated with plant growth, quality or yield, and as molecular Claim 1; SEQ ID NO 14482; 34pp; English tags to map genes.

Sequence 1, Application US/10512600

Sequence 1, Application US/10512600

Publication No. US200520210546A1

GENERAL INFORMATION:

APPLICANT: AGRINOMICS, LLC

TITLE OF INVERVITON: GENERATION OF PLANTS WITH IMPROVED PATHOGEN RESISTANCE

FILE REFERENCE: AGG3-033G-03

CURRENT APPLICATION NUMBER: US/10/512,600

CURRENT APPLICATION NUMBER: US 60/375,333

PRIOR APPLICATION NUMBER: US 60/375,333

PRIOR PILING DATE: 2002-04-24

NUMBER OF SEQ ID NOS: 14

SOFTWARE: Patentin version 3.2

SEQ ID NO 1

LENGTH: 381

TYPE: DNA

ORGANISM: Arabidopsis thaliana
